

From:  
Minsa Corporation.

To:  
Whom it might concern.

Minsa Corporation contracts only Pioneer hybrid seed varieties of corn. We purchase Pioneer Corn Seed 32B10 White Corn and 31N27 Yellow Corn farm and grown in the United States. Pioneer Hi-Bred International Inc. provides a validation certificate, which states that the approved varieties were developed by using traditional plant breeding without the use of Genetic Modification Techniques.

These products have been produced according to internationally acceptable standards and meet the accepted standards for seed purity. However, grain traits can be mingled genetically in the course of pollination or mechanically in the grain handling process. Thus, 100% purity, either in the genetic make-up or in the absence of foreign material content, is currently not achievable for any agriculture product including corn seed.

Minsa Corporation uses specific Whole Grain Non GMO corn for our Whole Grain Non GMO and Whole Grain Organic corn for our Whole Grain Organic specific flours, this corn has been isolated specifically for our Whole Grain Non GMO and Whole Grain Organic flour to meet the needs of our customers.

The Whole Grain Organic flours are produced from certified organic suppliers. The suppliers plant only Non GMO seed and test the corn after reaching storage and while cleaning. Organic Certification and Non GOM is a process, it doesn't guarantee a 100% purity status but the process from field to flour does provide security from cross contamination in the process. Non GMO testing is available for an additional fee.

All suppliers test for Starlink, Aflatoxin and Fumonisin prior to delivery at our facilities. Only Starlink free corn is accepted.

Minsa Corporation does certify that that our entire Whole Grain Non-GMO and Whole Grain Organic products are produce using only 100% Whole Grain Organic or Whole Grain Non-GMO corn.

Sincerely
